Open Access (OA)

-lock-in effect (most prestigious journals are non-OA, why publish OA)?

-OA is 'on the move': <https://creativecommons.org/>

Important but informal distinction:

- Green OA (self-archiving – possibly embargo, or non-final version)
- Gold OA (author pays – supported by e.g. NSF, ERC)
- Platinum OA ('no-one pays' – journal supported by institution)

Each has its disadvantages:

Green: embargo, or confusion about versions

Gold: enriches publishers, incentive for predatory journals ('MDPI', 'Frontiers in ...', Plos One, ...)

Platinum: difficult to sustain (but see EJTIR, in part ETRR)

Open Access (OA)

Gold OA is rapidly becoming the dominant OA option

1. Regular journals offering Gold OA-option
2. Gold OA-journals

Pitfall (2nd category): **author payment gives publisher incentive to publish as many papers as possible**

Result: quality concerns + prevalence of ‘predatory’ OA journals

But the field is regulating itself: check your prospective journal at <https://doaj.org/> (though not water-tight, too...)

[OA impact on citations hard to assess (why?) – mixed ‘evidence’]

Open Access (OA)

What about:

-ResearchGate

-Sci-Hub

-Pub Med

-Z-Library

ResearchGate

zlibrary
articles

Open Review (OR)

Editor-in-Chief (EiC)

- go = 'paper will be sent out for review via EiC or AE'
- no go = 'desk reject' >> END OF STORY...

Associate editor (AE) (responsible for finding reviewers)

→ 'anonymous' peer review

→ *open* : the reviews, the authors' responses, and the editors' decision are published alongside the article >> the readers can see how rigorous the peer-review process was and how the decision of the editors came about. Errors or gaps in the review process can be more easily noticed by fellow researchers. [e.g. PLOS One]

→ *open* : post-publication peer review or interactive peer review [e.g. F1000Research, ScienceOpen]

→ blind (single vs double)
